13 April 2018 International Conference on Hybrid Systems: Computation and Control Porto, Portugal

Controlled dynamical system and viability kernel

We consider the following controlled nonlinear system:

$$(S)\begin{cases} \dot{x} = f(x, u)\\ x(0) = x_0 \end{cases}$$

with $u(t) \in \mathcal{U} \subseteq \mathbb{R}^m$ the input and $x(t) \in \mathbb{R}^n$ the states, for all $t \ge 0$.

Controlled dynamical system and viability kernel

We consider the following controlled nonlinear system:

$$S)\begin{cases} \dot{x} = f(x, u)\\ x(0) = x_0 \end{cases}$$

with $u(t) \in \mathcal{U} \subseteq \mathbb{R}^m$ the input and $x(t) \in \mathbb{R}^n$ the states, for all $t \ge 0$.

Viability Kernel of K

Given a set of states K, its viability kernel Viab_S(K) is the set of all **initial** conditions for which there always exists a trajectory remaining inside K for an indefinite amount of time.

Controlled dynamical system and viability kernel

We consider the following controlled nonlinear system:

$$S)\begin{cases} \dot{x} = f(x, u)\\ x(0) = x_0 \end{cases}$$

with $u(t) \in \mathcal{U} \subseteq \mathbb{R}^m$ the input and $x(t) \in \mathbb{R}^n$ the states, for all $t \ge 0$.

Viability Kernel of K

 $\mathsf{Viab}_{\mathsf{S}}(K) := \{ x_0 \in K | (\exists u(t) \in \mathcal{U}) (\forall t \in [0, +\infty]) (\varphi(x_0, u(t), t) \in K) \},\$

 $\varphi(x_0, u(t), t)$ is the value of x(t) starting from x_0 with control input u(.).

Methods

Computing the viability kernel

Motivation

Computation of validated inner-approximation of viability kernels of non-linear continuous time (control) systems for safety analysis.

ELE NOR

Computing the viability kernel

Motivation

Computation of validated inner-approximation of viability kernels of non-linear continuous time (control) systems for safety analysis.

Some approaches from the literature:

- discretization-based [Saint-Pierre, 1994, Deffuant et al., 2007, Girard, 2012, Reissig et al., 2017].
- set-oriented or Lyapunov-like methods [Kaynama et al., 2012, She and Xue, 2013, Korda et al., 2013].
- interval based framework [Monnet et al., 2016].

• • = • • =

ELE DOG

Computing the viability kernel

Motivation

Computation of validated inner-approximation of viability kernels of non-linear continuous time (control) systems for safety analysis.

Some approaches from the literature:

- discretization-based [Saint-Pierre, 1994, Deffuant et al., 2007, Girard, 2012, Reissig et al., 2017].

ELE DOG

Methods

Sketch of the approach [Monnet et al., 2016]

A two phase method:

A two phase method:

 build an initial inner-approximation of the viability kernel (implemented by construction of Lyapunov-like functions)

A two phase method:

- build an initial inner-approximation of the viability kernel (implemented by construction of Lyapunov-like functions)
- II. improving the inner-approximation by computing iteratively its capture basin (implemented by validated numerical integration).

A two phase method:

- build an initial inner-approximation of the viability kernel (implemented by construction of Lyapunov-like functions)
- II. improving the inner-approximation by computing iteratively its capture basin (implemented by validated numerical integration).

Capture basin

Given a target set T, the capture basin of T within K for a time horizon t_{end} , $Capt_S^{t_{end}}(K, T)$, is the **the set of initial conditions** for which **there** exists a trajectory reaching T before t_{end} and without exiting K.

◇□◇ □□ ◇□ ◇ □ ◇ ○○

A two phase method:

- build an initial inner-approximation of the viability kernel (implemented by construction of Lyapunov-like functions)
- II. improving the inner-approximation by computing iteratively its capture basin (implemented by validated numerical integration).

Capture basin

$$\operatorname{Capt}_{S}^{t_{end}}(K,T) := \left\{ x_{0} \in K \middle| \begin{array}{c} (\exists \tilde{t} \in [0, t_{end}]) (\exists \tilde{u} \in \mathcal{U}) (\varphi(x_{0}, \tilde{u}(\tilde{t}), \tilde{t}) \in T) \\ \land (\forall t \in [0, \tilde{t}]) (\varphi(x_{0}, \tilde{u}(t), t) \in K)) \end{array} \right\}$$

A two phase method:

- build an initial inner-approximation of the viability kernel (implemented by construction of Lyapunov-like functions)
- II. improving the inner-approximation by computing iteratively its capture basin (implemented by validated numerical integration).

Capture basin

$$\mathsf{Capt}_{\mathcal{S}}^{t_{end}}(K,T) := \left\{ x_0 \in K \middle| \begin{array}{c} (\exists \tilde{t} \in [0, t_{end}]) (\exists \tilde{u} \in \mathcal{U}) (\varphi(x_0, \tilde{u}(\tilde{t}), \tilde{t}) \in T) \\ \land (\forall t \in [0, \tilde{t}]) (\varphi(x_0, \tilde{u}(t), t) \in K)) \end{array} \right\}$$

$$\mathcal{T} \subseteq \mathsf{Viab}_{\mathcal{S}}(\mathcal{K}) \implies \mathsf{Capt}_{\mathcal{S}}^{t_{\mathsf{end}}}(\mathcal{K},\mathcal{T}) \subseteq \mathsf{Viab}_{\mathcal{S}}(\mathcal{K}), \; \forall t_{\mathsf{end}} \geqslant 0$$

Interval Analysis

Notations:

$$[x] = [\underline{x}, \overline{x}] = \{x \in \mathbb{R} : \underline{x} \leqslant x \leqslant \overline{x}\}.$$

 \mathbb{IR} : set of real intervals. Boxes: interval vectors.

三日 のへの

Interval Analysis

Notations:

$$[x] = [\underline{x}, \overline{x}] = \{x \in \mathbb{R} : \underline{x} \leqslant x \leqslant \overline{x}\}.$$

 \mathbb{IR} : set of real intervals. Boxes: interval vectors.

Main tools:

Interval extensions: over-approximation of functions over interval inputs.

Contractors: contract a box removing inconsistent values (*w.r.t* some properties).

Interval Newton: prove existence of solutions to a system of equations.

Validated integration: over-approximation of trajectories.

[Neumaier, 1991, Jaulin et al., 2001]

ELE DOG

Two phase algorithm [Monnet et al., 2016] is expensive. \implies towards improving it:

A (1) > A (2) > A

ELE DOG

Two phase algorithm [Monnet et al., 2016] is expensive.

- \implies towards improving it:
 - enhancing the improvement phase by more efficient validated numerical integration (done by Olivier Mullier, not detailed in this talk)

Goal

Two phase algorithm [Monnet et al., 2016] is expensive.

- \implies towards improving it:
 - enhancing the improvement phase by more efficient validated numerical integration (done by Olivier Mullier, not detailed in this talk)
 - enhancing the first phase by generating large inner-approximations (this talk and paper)

Goal

Two phase algorithm [Monnet et al., 2016] is expensive.

- \implies towards improving it:
 - enhancing the improvement phase by more efficient validated numerical integration (done by Olivier Mullier, not detailed in this talk)
 - enhancing the first phase by generating large inner-approximations (this talk and paper)

Idea

Taking more time for computing larger initial inner-approximation may reduce significantly the cost of the improvement phase.

First phase: original method

Find a function $h : \mathbb{R}^n \to \mathbb{R}$ of the states *s*.*t*

$$(\forall x \in K), \ h(x) = 0 \implies \exists u \in \mathcal{U}, \ \dot{h}(x, u) < 0,$$
 (1)

with $\dot{h}(x, u) := \langle \nabla_x h(x), f(x, u) \rangle$.

EL SQA

First phase: original method

Find a function $h : \mathbb{R}^n \to \mathbb{R}$ of the states *s.t*

$$(\forall x \in K), \ h(x) = 0 \implies \exists u \in \mathcal{U}, \ \dot{h}(x, u) < 0,$$
 (1)

with $\dot{h}(x, u) := \langle \nabla_x h(x), f(x, u) \rangle$.

Property

Let *h* be a function satisfying (1), define $\mathcal{H} := \{x \in K | h(x) \leq 0\}$. Then if $\mathcal{H} \subset \operatorname{int} K$, then $\mathcal{H} \subset \operatorname{Viab}_{\mathcal{S}}(K)$.

A = A = A = A = A = A

First phase: original method

Find a function $h : \mathbb{R}^n \to \mathbb{R}$ of the states *s.t*

$$(\forall x \in K), \ h(x) = 0 \implies \exists u \in \mathcal{U}, \ \dot{h}(x, u) < 0,$$
 (1)

with $\dot{h}(x, u) := \langle \nabla_x h(x), f(x, u) \rangle$.

Property

Let *h* be a function satisfying (1), define $\mathcal{H} := \{x \in K | h(x) \leq 0\}$. Then if $\mathcal{H} \subset \operatorname{int} K$, then $\mathcal{H} \subset \operatorname{Viab}_{\mathcal{S}}(K)$.

Implementation in [Monnet et al., 2016]: construction of Lyapunov-like function from the linearized system around equilibrium points.

(further reductions of parameter and state space via contractors [Chabert and Jaulin, 2009])

CSC-FPS: discussion

Limitations for our application

I. CSC cannot contradict (2), *i.e.* prove that a *p* satisfy:

$$\exists x \in K, \ h_p(x) = 0 \land \forall u \in \mathcal{U}, \ \dot{h}_p(x, u) \ge 0.$$

II. Does not consider the "quality" of the returned parameter. III. Uncontrolled case.

CSC-FPS: discussion

What we propose for I.

I. : Finding counter-examples

In [Ishii et al., 2012], a Branch & Prune method for solving problems as negation of (2) (uncontrolled case) \rightarrow Use of parametric interval Newton for finding counter-examples to (2).

伺 ト イヨト イヨト ヨヨ のくら

What we propose for I.

I. : Finding counter-examples

In [Ishii et al., 2012], a Branch & Prune method for solving problems as negation of (2) (uncontrolled case) \rightarrow Use of parametric interval Newton for finding counter-examples to (2).

Parametric interval Newton

An interval contractor $\mathcal{N}_{[y]}(.) : \mathbb{IR}^n \to \mathbb{IR}^n$, with respect to a system of equations $h(y, z) = 0, h : \mathbb{R}^{q+n} \to \mathbb{R}^n$ which satisfies

$$\forall [z] \in \mathbb{IR}^n, \ \mathcal{N}_{[y]}([z]) \subset [z] \implies \forall y \in [y], \ \exists z \in [z], \ h(y, z) = 0$$

What we propose for I.

I. : Finding counter-examples

In [Ishii et al., 2012], a Branch & Prune method for solving problems as negation of (2) (uncontrolled case) \rightarrow Use of parametric interval Newton for finding counter-examples to (2).

Parametric interval Newton

An interval contractor $\mathcal{N}_{[y]}(.) : \mathbb{IR}^n \to \mathbb{IR}^n$, with respect to a system of equations $h(y, z) = 0, h : \mathbb{R}^{q+n} \to \mathbb{R}^n$ which satisfies

Design of the algorithm

Illustration

What we propose for II

II. : Optimizing via Branch & Bound

FPS loop is now a Branch & Bound :

- Each iteration selects a preferred box [p] (from the search tree).
- Validates with CSC a point p ∈ [p] or try to reject all [p]. If p is valid, cuts the branch that are worse.
- Stops when a sufficiently good point \hat{p} is found.

What we propose for II

II. : Optimizing via Branch & Bound

FPS loop is now a Branch & Bound :

- Each iteration selects a preferred box [p] (from the search tree).
- Validates with CSC a point p ∈ [p] or try to reject all [p]. If p is valid, cuts the branch that are worse.
- Stops when a sufficiently good point \hat{p} is found.

Specificities

- Definition of a "best" parameter p. Ideal: max vol H_p. Practice: min an approximate function g(p).
- Efficient exploration strategy. Following [Neveu et al., 2016], we chose two orderings of the parameter boxes: min LB and max UB.

What we propose for III.

III. Relaxation by sampling feasible controls

Relaxation of (2): consider a finite set of control functions $\{u_1, u_2, \ldots, u_k\}$, then (2) can be relaxed to:

$$\forall x \in K \ h_p(x) \neq 0 \bigvee_{i=1}^k \langle \nabla_x h_p(x), f(x, u_i) \rangle < 0.$$

Choices for the u_i : constant (interval) function, state feedback, ...

Balancing on a rod

Consider the system:

$$\begin{cases} \dot{y}_1 = y_2(t) \\ \dot{y}_2 = \cos(y_1(t)) \left(u_1(t)y_1(t) + u_2(t)y_2(t) \right) + 9.81 \sin(y_1(t)). \end{cases}$$

using $K = \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \times \left[-\pi, \pi\right]$ and $\mathcal{U} = \left[-15, 15\right] \times \left[-2, 2\right]$. Same template centered on the origin.

Balancing on a rod

ELE DQC

Improving validated algorithm [Monnet et al., 2016]:

EL SQA

Improving validated algorithm [Monnet et al., 2016]:

• generalization of the first-phase: solving QCSP,

ELE DOG

Improving validated algorithm [Monnet et al., 2016]:

- generalization of the first-phase: solving QCSP,
- higher cost, but trades favorably with the gain in the improvement phase.

ELE NOR

Improving validated algorithm [Monnet et al., 2016]:

- generalization of the first-phase: solving QCSP,
- higher cost, but trades favorably with the gain in the improvement phase.

Future work:

• Scalability is an issue (mainly in parameter space). Few effective contractors on *p*.

ELE DOG

Improving validated algorithm [Monnet et al., 2016]:

- generalization of the first-phase: solving QCSP,
- higher cost, but trades favorably with the gain in the improvement phase.

Future work:

- Scalability is an issue (mainly in parameter space). Few effective contractors on *p*.
- Identifying promising templates.

Improving validated algorithm [Monnet et al., 2016]:

- generalization of the first-phase: solving QCSP,
- higher cost, but trades favorably with the gain in the improvement phase.

Future work:

- Scalability is an issue (mainly in parameter space). Few effective contractors on *p*.
- Identifying promising templates.
- Quickly finding feasible parameters (see e.g. [Hladík and Ratschan, 2014]).

ELE DOG
